Clinical Image

Fan Retractor (V. Mueller- BD, Franklin Lakes, NJ) has been shown to cause cardiac complication during Laparoscopic Nissen Fundoplication [1]. We present patient where this retractor facilitated cardiac surgery. A 54-year-old male with no significant past medical history, experienced increasing dyspnea over last six months. He was active and worked as delivery person. During his work up, heart murmur led to further investigation which demonstrated prolapse of posterior mitral leaflet and severe mitral regurgitation on echocardiography. He opted for mitral valve surgery through right minithoracotomy (Figure 1 and 2). Once minithoracotomy was performed, right hepatic lobe was observed herniating from medial aspect of diaphragm, obstructing view to pericardium. A 34 cm Fan Retractor (V. Mueller- Becton Dickinson, Franklin Lakes, NJ) was inserted through right sub costal port and retracted herniating hepatic lobe inferiorly. Adequate exposure of pericardium led to successful mitral valve repair and retractor was removed at operation's completion. There was no trauma to herniated lobe.

Figure 1: Herniating right hepatic lobe obstructing pericardial exposure through a right minithoracotomy.

Figure 2: Fan retractor facilitating pericardial exposure.
